

Workflow Process

1. Monitor Incoming Documents

The workflow continuously monitors a designated Google Drive folder for newly uploaded business documents, such as:

- Purchase Orders (POs)
- Invoices
- Vendor Documents

Node: Google Drive Trigger

↓

2. Download Document

When a new file is detected, the workflow automatically downloads the document for processing.

Node: Download Document

↓

3. Extract Text Using OCR

The document is sent to OCR.space to convert scanned images or PDFs into machine-readable text.

Input: PDF/Image

Output: Raw text

Node: OCR Extraction

↓

4. Clean and Prepare OCR Data

The extracted OCR text is cleaned and formatted before being sent to the AI model.

The workflow also stores:

- File name
- File ID
- OCR text

Node: Prepare OCR Text

↓

5. AI-Powered Data Extraction

A local Ollama Hermes model analyzes the document and extracts structured business information.

Examples:

- Document Type
- Invoice Number
- PO Number
- Vendor Name
- Date
- Line Items
- Subtotal
- Tax
- Total Amount

Node: Ollama – Hermes Extract Fields

↓

6. Validate Extracted Information

Business validation rules verify the extracted data.

Checks include:

- Required fields exist
- Critical fields are present
- The JSON structure is valid
- Totals are consistent

Examples:

Document Type	Required Fields
Invoice	Invoice Number, Vendor, Total
Purchase Order	PO Number, Vendor, Total

Node: Validate Extracted Fields

↓

7. Decision Point

The workflow determines whether the document passes validation.

Node: IF Validation Passed

If Validation Fails

The document is routed to manual review.

If Validation Passes

The document continues to undergo automated processing.

↓

8. Generate AI Purchase Summary

Hermes generates a business-friendly summary explaining whether the invoice appears to match a standard PO-based purchase.

Example:

"The invoice appears consistent with a standard purchase order transaction. Vendor information and totals align with expected purchasing records."

Node: Ollama – Hermes PO Match Summary

↓

9. Export Structured Data

Validated data is exported into a spreadsheet that can serve as:

- ERP staging area
- Accounting import sheet
- Reporting database
- Audit log

Node: Export to Excel/ERP Sheet

↓

10. Human Review Notifications

If validation fails, the workflow automatically sends an email containing:

- File name
- Vendor
- Invoice Number
- PO Number
- Missing fields
- Validation issues

This enables a Human-in-the-Loop (HITL) review process.

Node: Send Email

End-to-End Flow
